WEBSITE SEO AUDIT REPORT

Practice Project: AKOO
Website: https://www.akoo.com/
Audit Date: November 1, 2026
Prepared by: Yash
Focus: SEO & Website Optimization

---

1. Website Overview

AKOO is an international clothing and fashion e-commerce website.

This independent practice audit reviews the website's homepage using Google PageSpeed Insights and Google's Rich Results Test.

The purpose is to identify potential opportunities to improve website performance, basic SEO, and structured data.

2. Website Performance

Metric	Mobile	Desktop
Performance	43/100	71/100
Accessibility	100/100	100/100
Best Practices	96/100	96/100
SEO	92/100	92/100

Core Web Vitals: Passed on both mobile and desktop real-user assessments.

Important Note: Real-user Core Web Vitals and Lighthouse lab tests measure performance differently. Real-user assessments passed, while simulated mobile testing showed slower loading performance.

3. Technical Findings

Mobile Results

- Largest Contentful Paint (LCP): 14.0 seconds
- Total Blocking Time (TBT): 1,030 ms
- Total page payload: Approximately 4.6 MB
- Estimated unused JavaScript savings: 527 KB
- Estimated image delivery savings: 239 KB

Desktop Results

- Largest Contentful Paint (LCP): 1.1 seconds
- Total Blocking Time (TBT): 830 ms
- Total page payload: Approximately 4.46 MB
- Estimated unused JavaScript savings: 528 KB
- Estimated image delivery savings: 183 KB

These results indicate opportunities to investigate JavaScript execution, image delivery, and page loading resources.

4. SEO and Structured Data

The following findings were identified:

- Lighthouse SEO score: 92/100 on both mobile and desktop.
- One link was flagged for non-descriptive link text.
- Google Rich Results Test detected one valid Breadcrumb structured-data item.
- The tested homepage was crawled successfully.

The structured-data result applies only to the tested page and does not confirm that every page has valid structured data.

5. Main Improvement Opportunities

Based on the test results, the following improvements are recommended:

1. **JavaScript Optimization:** Review JavaScript loading and execution to reduce main-thread blocking.
2. **Image Optimization:** Review image sizes, formats, and delivery methods to reduce unnecessary page weight.
3. **Render-blocking Resources:** Investigate resources that delay page rendering.

4. **Descriptive Link Text:** Review links and make their purpose clearer to visitors and search engines.
5. **Structured Data:** Review breadcrumb structured data and check its implementation across relevant pages.

These are recommendations for further investigation, not confirmed fixes.

6. Conclusion

The audit identified opportunities to improve simulated mobile loading performance, particularly JavaScript execution, image delivery, and render-blocking resources.

Although real-user Core Web Vitals passed, further technical investigation is recommended to improve the mobile experience.

The results also identified a link with non-descriptive text and an opportunity to review structured data.

No changes were made to the website during this practice audit.

7. Tools Used

- Google PageSpeed Insights
- Google Rich Results Test

8. Audit Limitations

- Only AKOO's homepage was tested, not the entire website.
- Performance findings include Lighthouse simulated lab results and real-user Chrome UX Report data.
- No website code, content, or settings were modified.
- Recommendations are based on the available test results and require further investigation before implementation.

Project Disclaimer

This is an independent educational practice audit prepared for portfolio demonstration purposes. It was not commissioned by, affiliated with, or conducted on behalf of AKOO. All findings are based on the tests performed on November 1, 2026.
